# The Parts of Speech

The parts of speech (POS) are classes that correspond to the lexical – or word – categories

Plato made a distinction between the verb and the noun.

After him, the word categories further evolved and grew in number until Dionysus Thrax formulated and fixed them.

Aelius Donatus popularized the list of the eight parts of speech: noun, pronoun, verb, participle, conjunction, adverb, preposition, and interjection.

Grammarians have adopted these POS for most European languages although they are somewhat arbitrary

POS divide between two main classes: the open class and the closed class

# Parts of Speech: Open Class Words

POS	English	French	German
Nouns	<i>name, Frank</i>	<i>nom, François</i>	<i>Name, Franz</i>
Adjectives	<i>big, good</i>	<i>grand, bon</i>	<i>groß, gut</i>
Verbs	<i>to swim</i>	<i>nager</i>	<i>schwimmen</i>
Adverbs	<i>rather, very, only</i>	<i>plutôt, très, uniquement</i>	<i>fast, nur, sehr, endlich</i>

# Parts of Speech: Closed Class Words

POS	English	French	German
Determiners	<i>the, several, my</i>	<i>le, plusieurs, mon</i>	<i>der, mehrere, mein</i>
Pronouns	<i>he, she, it</i>	<i>il, elle, lui</i>	<i>er, sie, ihm</i>
Prepositions	<i>to, of</i>	<i>vers, de</i>	<i>nach, von</i>
Conjunctions	<i>and, or</i>	<i>et, ou</i>	<i>und, oder</i>
Auxiliaries and modals	<i>be, have, will, would</i>	<i>être, avoir, pouvoir</i>	<i>sein, haben, können</i>

# Annotation with Parts of Speech

Sentence:

*That round table might collapse*

Annotation:

Words	Parts of speech	POS tags
<b>that</b>	Determiner	DET
<b>round</b>	Adjective	ADJ
<b>table</b>	Noun	NOUN
<b>might</b>	Modal verb	AUX
<b>collapse</b>	Verb	VERB

The automatic annotation uses predefined POS tagsets such as the Penn Treebank tagset for English

# Training Sets: The CoNLL Format

The CoNLL format is a tabular format to distribute annotated texts. This format was created for evaluations carried out by the Conference in natural language learning

The CoNLL annotation has varied much across the years. We use CoNLL-U, the latest iteration.

Annotation of the Spanish sentence:

*La reestructuración de los otros bancos checos se está acompañando por la reducción del personal*

*'The restructuring of Czech banks is accompanied by the reduction of personnel'*

# Example of Annotation (CoNLL-U)

*La reestructuración de los otros bancos checos se está acompañando por la reducción del personal*

# Ambiguity

Words	Possible tags	Example of use
<b>that</b>	Subordinating conjunction	<i>That he can swim is good</i>
	Determiner	<i>That white table</i>
	Adverb	<i>It is not that easy</i>
	Pronoun	<i>That is the table</i>
	Relative pronoun	<i>The table that collapsed</i>
<b>round</b>	Verb	<i>Round up the usual suspects</i>
	Preposition	<i>Turn round the corner</i>
	Noun	<i>A big round</i>
	Adjective	<i>A round box</i>
	Adverb	<i>He went round</i>
<b>table</b>	Noun	<i>That white table</i>
	Verb	<i>I table that</i>
<b>might</b>	Noun	<i>The might of the wind</i>
	Modal verb	<i>She might come</i>
<b>collapse</b>	Noun	<i>The collapse of the empire</i>
	Verb	<i>The empire can collapse</i>

# Part-of-Speech Ambiguity in Swedish

The word *som* in the *Norstedts svenska ordbok*, 1999, has three entries:

- ① *Om jag vore lika vacker som du, skulle jag vara lycklig.* (konjunktion)
- ② *Bilen som jag köpte i fjol.* (pronomen)
- ③ *Som jag har saknat dig.* (adverb)

The part-of-speech difference can be significant:

Swedish. Compare the pronunciation of *vaken*, adjective, as in *Han är aldrig vaken innan klockan sju* and *vaken*, noun, as in *Vi fiskade i vaken i sjön*

English. Compare *object* in *I object to violence*, verb, or *I could see an object*, noun.

# Course Content: 2022

The rest of the slides in this document is not part of the course in 2022.

You can nonetheless read it if you are curious.

# Features

Main parts of speech	Features (subcategories)
Adjective, noun, pronoun	Regular base comparative superlative interrogative person number case
Adverb	Regular base comparative superlative interrogative
Article, determiner, preposition	Person case number
Verb	Tense voice mood person number case

# Lexicons: An Excerpt from the Oxford Advanced Learner's Dictionary

F	<i>Marche</i>	<ol style="list-style-type: none"> <li>1 Une <b>marche</b> dans la forêt</li> <li>2 Il <b>marche</b> dans la cour</li> </ol>	<ol style="list-style-type: none"> <li>1 <b>marche</b>: noun sing. fem.</li> <li>2 <b>marcher</b>: verb present third pers. sing.</li> </ol>
G	<i>Lauf</i>	<ol style="list-style-type: none"> <li>1 Der <b>Lauf</b> der Zeit</li> <li>2 <b>Lauf</b> schnell!</li> </ol>	<ol style="list-style-type: none"> <li>1 <b>Der Lauf</b>: noun sing, masc</li> <li>2 <b>laufen</b>: verb, imp. sing.</li> </ol>

# Two-Level Morphology

Current morphological parsers are based on the two-level model of Kimmo Koskenniemi (1983).

It links the surface form of a word – the word as it is in a text – to its lexical or underlying form – its sequence of morphemes

<b>Surface:</b>	disentangled
-----------------	--------------

<b>Lexical (or underlying):</b>	dis+en+tangle+ed
---------------------------------	------------------

# Examples

---

## Generation: Lexical to surface form →

---

English	<i>dis+en+tangle+ed</i>	<i>disentangled</i>
	<i>happy+er</i>	<i>happier</i>
	<i>move+ed</i>	<i>moved</i>
French	<i>dés+em+brouiller+é</i>	<i>désembrouillé</i>
	<i>dé+chanter+erons</i>	<i>déchanterons</i>
German	<i>ent+wirren+end</i>	<i>entwirrend</i>
	<i>wieder+ge+schreiben+en</i>	<i>wiedergeschrieben</i>

---

## Parsing: ← Surface to lexical form

---

# Aligning the Two Forms

English	dis+en+tangle+ed ⇕ ... dis0en0tangl00ed	happy+er ⇕ ... happi0er	move+ed ⇕ ... mov00ed
French	dé+chanter+erons ⇕ ... dé0chant000erons	cheval+ux ⇕ ... cheva00ux	cheviller+é ⇕ ... chevill000é
German	singen+st ⇕ ... sing00st	Grund+`e ⇕ ... Gründ00e	Igel+Ø ⇕ ... Igel00

# Interpreting the Morphemes

Suffixes have a grammatical interpretation: *erons* in a French verb corresponds to verb + future + 1st person + plural  
Morphological parsers can represent the lexical form as a concatenation of the stem and its features instead of the stem and the suffix.  
The Xerox parser output for *disentangled* and *happier* is:

disentangle+Verb+PastBoth+123SP

happy+Adj+Comp

where +Verb denotes a verb, +PastBoth, either past tense or past participle, and +123SP any person, singular or plural; +Adj denotes an adjective and +Comp, a comparative.

# Transducers

The string *abbbc* is transduced into *zyyyx*

# Mathematical Definition of a FST

- ①  $Q$  is a finite set of states.
- ②  $\Sigma$  is a finite set of symbol or character pairs  $i : o$ , where  $i$  is a symbol of the input alphabet and  $o$  of the output alphabet. As we saw, both alphabets may include epsilon transitions.
- ③  $q_0$  is the start state,  $q_0 \in Q$ .
- ④  $F$  is the set of final states,  $F \subseteq Q$ .
- ⑤  $\delta$  is the transition function  $Q \times \Sigma \rightarrow Q$ , where  $\delta(q, i, o)$  returns the state where the automaton moves when it is in state  $q$  and consumes the input symbol pair  $i : o$ .

The quintuple defining automaton is  $Q = \{q_0, q_1, q_2\}$ ,

$\Sigma = \{a : z, b : y, c : x\}$ ,

$\delta = \{\delta(q_0, a : z) = q_1, \delta(q_1, b : y) = q_1, \delta(q_1, c : x) = q_2\}$ , and  $F = \{q_0\}$ .

# French Verb Transducers for *chanter*

transduce(Start, Final, [U | UnderlyingString],  
    [S | SurfaceString]) :-  
    arc(Start, Next, U, S),  
    U \== 0, S \== 0,  
    transduce(Next, Final, UnderlyingString, SurfaceString).  
transduce(Final, Final, [], []) :- final_state(Final).
```

# Transducers with OpenFst

OpenFst is a library to create and process transducers. We encode the lexical and surface forms of the conjugation as:

1 1 a a	10 11 z z
1 1 b b	6 12 o o
1 1 c c	12 13 n n
...	13 14 s s
1 2 e <epsilon>	13 15 t t
2 3 r <epsilon>	7
3 4 + <epsilon>	8
4 5 e e	9
5 6 r r	11
6 7 a a	14
7 8 i i	15
7 9 s s	
6 10 e e	

that we store the `first_group_future.fst` file.

# Transducers with OpenFst (II)

We encode rêver+era as a single chain automaton:

```
0 1 r
1 2 ê
2 3 v
3 4 e
4 5 r
5 6 +
6 7 e
7 8 r
8 9 a
9
```

```
$ fstcompile --isymbols=symbols.txt --osymbols=symbols.txt \
  first_group_future.fst first_group_future.bin
$ fstcompile --isymbols=symbols.txt --acceptor \
  rêver+era.fst rêver+era.bin
```

where the `symbols.txt` file contains all the letters of the alphabet and

# Transducers with OpenFst (III)

We generate the surface form by composing the input with the transducer:

```
$ fstcompose rêver+era.bin first_group_future.bin | \  
  fstprint --isymbols=symbols.txt --osymbols=symbols.txt  
0 1 r r  
1 2 ê ê  
2 3 v v  
3 4 e <epsilon>  
4 5 r <epsilon>  
5 6 + <epsilon>  
6 7 e e  
7 8 r r  
8 9 a a  
9
```

# Transducers with OpenFst (IV)

To remove the  $\epsilon$ , we need to project the results using the `fstproject` command that restricts a transducer to an acceptor with only the output and we and apply the `fstrmepsilon` command:

```
$ fstcompose rêver+era.bin first_group_future.bin | \  
  fstproject --project_output | fstrmepsilon | \  
  fstprint --isymbols=symbols.txt --osymbols=symbols.txt
```

0 1 r r

1 2 ê ê

2 3 v v

3 4 e e

4 5 r r

5 6 a a

6

# Romance Languages

Language	Number\Person	First	Second	Third
Italian				
	singular	<i>canterò</i>	<i>canterai</i>	<i>canterà</i>
	plural	<i>canteremo</i>	<i>canterete</i>	<i>canteranno</i>
Spanish				
	singular	<i>cantaré</i>	<i>cantarás</i>	<i>cantará</i>
	plural	<i>cantaremos</i>	<i>cantaréis</i>	<i>cantarán</i>
Portuguese				
	singular	<i>cantarei</i>	<i>cantarás</i>	<i>cantará</i>
	plural	<i>cantaremos</i>	<i>cantareis</i>	<i>cantarão</i>

# Ambiguity

In the transducer for future tense, there is no ambiguity: A surface form has only one lexical form with a unique final state.

This is not the case with the present tense

(je) *chante* 'I sing'

(il) *chante* 'he sings'

Number\Person	First	Second	Third
singular	<i>chante</i>	<i>chantes</i>	<i>chante</i>
plural	<i>chantons</i>	<i>chantez</i>	<i>chantent</i>

# Transducer Ambiguity

Final states 5 and 7 are the same.

The implementation in Prolog is similar to that of the future tense. Using backtracking, the transducer can produce all the final states reflecting the morphological ambiguity.

# Koskenniemi's Rules

Koskenniemi described morphology with declarative rules.

They use the left and right context and the  $\Rightarrow$ ,  $\Leftarrow$ ,  $\Leftrightarrow$ , or  $/\Leftarrow$  operators

In English, a lexical *y* can correspond to a surface *i* as in *happier*.

It occurs when *y* is preceded by a consonant and followed by *-er*, *-ed*, or *-s*.

①  $y:i \Leftarrow C:C \_ \_ +:0 \ e:e \ r:r$

②  $y:i \Leftarrow C:C \_ \_ +:e \ s:s$

③  $y:i \Leftarrow C:C \_ \_ +:0 \ e:e \ d:d$

# Two-level Rules

Lexical:surface transduction is described by rules.

Rules	Description
a:b $\Rightarrow$ lc __ rc	a is transduced as b <b>only</b> when it has lc to the left and rc to the right
a:b $\Leftarrow$ lc __ rc	a is <b>always</b> transduced as b when it has lc to the left and rc to the right
a:b $\Leftrightarrow$ lc __ rc	a is transduced as b <b>always and only</b> when it has lc to the left and rc to the right
a:b $/\Leftarrow$ lc __ rc	a is <b>never</b> transduced as b when it has lc to the left and rc to the right

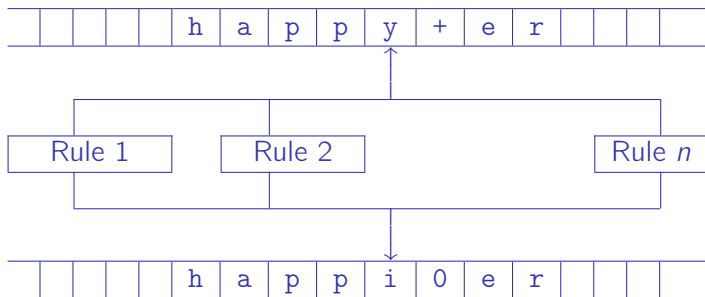

# Parallel Rules

All the rules are applied in parallel (provided that their context match)

# Rules and Transducers

Rules can be compiled as an equivalent transducer

# Rule Intersection

The parallel transducers are then combined into a single one using the transducer intersection.

# Problems with Intersection

The intersection of two finite automata defines a finite-state automaton. It is not always the case for finite-state transducers.

Kaplan and Kay (1994) demonstrated that when surface and lexical pairs have the same length – without  $\epsilon$  –, the intersection is a transducer.

This property is sufficient to intersect the rules in practical applications.

In fact, transducers obtained from two-level rules are intersected by treating the  $\epsilon$  symbol as an ordinary symbol (Beesley and Karttunen 2003, p. 55).

# Xerox

Originally, rules were compiled by hand.

However, it can quickly become intractable especially when it comes to managing conflicting rules or when rule contexts interfere with transduced symbols.

To solve it, we can use a compiler that creates transducers automatically from two-level rules.

The Xerox's XFST is an example of it. It is a publicly available tool and to date the only serious implementation of a morphological rule compiler.

# Morphology of French Verbs

We used the stem and a set of suffixes for French regular verbs.

French irregular verbs are notoriously more complex.

Chanod (1994) gives an example of decomposition into simple rules.

<b>Infinitive</b>	<b>courir</b>	<b>dormir</b>	<b>battre</b>	<b>peindre</b>	<b>écrire</b>
First person sing.	cours <u>s</u>	<b>dors</b>	<b>bats</b>	<b>peins</b>	écris
Second person sing.	cours <u>s</u>	<b>dors</b>	<b>bats</b>	<b>peins</b>	écris
Third person sing.	court <u>t</u>	<b>dort</b>	<b>bat</b>	<b>peint</b>	écrit
First person pl.	cour <u>ons</u>	dormons	battons	peignons	<b>écrivons</b>
Second person pl.	cour <u>ez</u>	dormez	battez	peignez	<b>écrivez</b>
Third person pl.	cour <u>ent</u>	dorment	battent	peignent	<b>écrivent</b>

# French Morphology
